ABSTRACT

The invention relates to a method for coating a substrate, comprising the steps of:

- a) Applying a layer comprising a melamine-formaldehyde resin A to a substrate,
 whereby a coated substrate is formed;
 - b) Optionally treating the coated substrate with IR- or NIR- radiation;
 - c) Optionally applying an ink, dye solution or pigment dispersion to the coated substrate;
- 10 d) Optionally applying a layer comprising a melamine-formaldehyde resin B to the coated substrate from step b) or c);
 - e) Placing the coated substrate in a press;
 - f) Optionally heating the coated substrate in the press for a certain amount of time;
- g) Increasing the pressure in the press and keeping the coated substrate under
 pressure for a certain amount of time.

The invention further relates to a coated substrate as obtainable by the said method, and its use in a post-forming process.
